Milk Trace

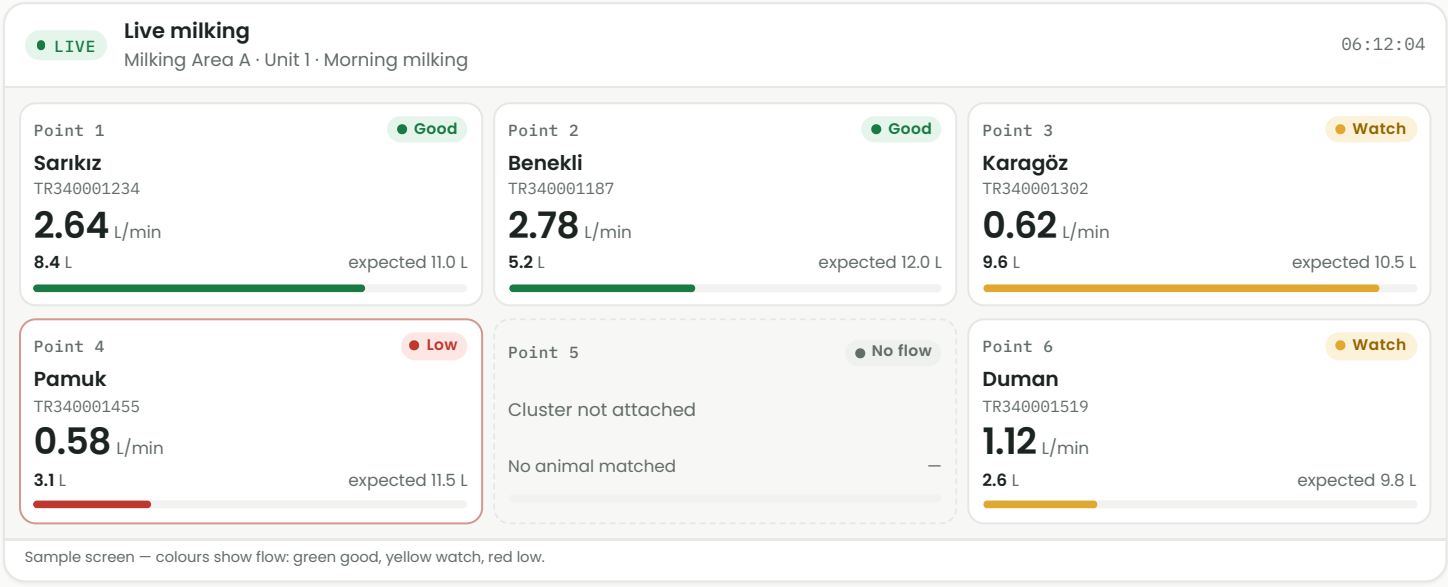
milktrace.com.tr

TRADITIONAL FARMING, DIGITAL PRECISION

Every drop, traced to its source.

Milk Trace measures how much milk every cow, goat and sheep gives, during milking, with meters fitted at each milking point. It tells you about falling yield, slow milkers and faulty meters before you notice.

- ✓ Litres per animal, during milking
- ✓ Separate thresholds for cows, goats and sheep
- ✓ On phone, tablet and computer
- ✓ 14-day free trial after installation



Sample screen — colours show flow: green good, yellow watch, red low.

Works in three steps

1. **A meter is fitted**
   A milk meter (flow meter) is fitted at each milking point. Our team installs it; the meters measure flow second by second during milking.
2. **The animal is matched**
   With an RFID ear-tag reader the animal is recognised automatically. Without one, the milker links the animal to the point with a single tap; the app suggests the layout of the previous milking.
3. **Data flows**
   Every milking lands on the animal's record: live screen, daily totals, yield class, trend and reports. You get a notification when something is wrong.

What you get

Yield per animal
7- and 30-day averages, a 90-day chart, a 305-day projection and a yield class. Animals in decline and candidates for drying off are listed separately.

Herd records
Insemination, pregnancy, heat and expected calving; vaccination schedule; treatments and withdrawal periods. Milk from an animal under withdrawal is flagged "withhold milk".

Meter health
Offline meters, reported errors, calibration due and points that measure low flow compared with their unit are each flagged.

Alerts on time
Missed milking, silent meter, heat stress, upcoming calving. Push, email, SMS or voice call; during your quiet hours only critical alerts ring.

Tank collection and quality
Enter the tanker slip; it is compared with the measured milk and you are warned when the difference crosses your threshold. Enter the dairy analysis and follow the somatic cell trend on a chart.

Reports
Download the yield report for the last 7, 30 or 90 days as Excel and share it with your vet or consultant in one tap.

Separate thresholds per species

Cow `default ≥ 2.5 L/min`

Goat `default ≥ 0.8 L/min`

Sheep `default ≥ 0.5 L/min`

Your milk quality, in front of your dairy

Share the quality and volume of your milk with your dairy in real time, strictly with your consent, and earn premium support for your milk as a trusted supplier.
